    "Spy2K
```

Spy2K is a Unity-based PC game that I developed with a team of students in my fourth year at Brock. I took on the role of Lead Programmer and built the game with my Technical Team.

Spy2K is a split-screen strategy game in which two players compete to be the first one to solve the Y2K bug. Players must snip wires, crack safes, brute-force passwords, and more in order to get their hands on all three pieces of the fabled CD holding the solution to Y2K.

Both players are looking for the same answer to each puzzle, so players are encouraged to screen-peek and cheat off their opponent! Players also have devious spies at their disposal to mess up their rival and get the upper hand.”,

```
    "Mercs: Triple Threat
```

Mercs is an HTML/WebGL-based mobile game that I developed with a team of students in my third year at Brock. It plays kind of like Final Fantasy 7's combat system, with different Mercs armed with their own unique attacks and abilities.

It's like rock-paper-scissors, but with badass mercenaries instead of household objects!”,

```
    "Game Analysis 2 (Bloodborne: Is It All a Dream?)
```

For this university assignment, I created a short interactive essay in the form of a top-down adventure game using GameMaker: Studio. It analysed the game Bloodborne, touched on some of its key themes, and explored its story.

What better way to learn about games than by playing one?”];
